

PSET 1:

1

a

$$Y_{24} = 8 \times 5 + 4 \times 4 = 56$$

$$Y_{25} = 2 \times 12 + 6 \times 3 = 42$$

b

$$\left. \begin{array}{l} Y_{25|P_{24}} = 8 \times 12 + 4 \times 3 = 108 \\ Y_{24|P_{24}} = 56 \end{array} \right\} g_Y = 92,8\%$$

c

$$\left. \begin{array}{l} Y_{25|P_{25}} = 42 \\ Y_{24|P_{25}} = 2 \times 5 + 6 \times 4 = 34 \end{array} \right\} g_Y = 23,5\%$$

$$P_1: 8 \rightarrow 2$$

$$P_2: 4 \rightarrow 6$$

d

$$Y = \frac{40}{25} \times 1 + \frac{8}{25} \times 2 = 2,24$$

③

Preços BR/24

$$Y_{24/PPC} = 8 \times 1 + 4 \times 2 = 16$$

[4]

$$SS \rightarrow K_{SS} = \left[\frac{s}{n+\delta} \right]^{\frac{1}{1-\alpha}} \rightarrow y = (K_{SS})^\alpha = \left[\frac{s}{n+\delta} \right]^{\frac{\alpha}{1-\alpha}}$$

$$c_{SS} = (1-s)y_{SS} = (1-s) \left[\frac{s}{n+\delta} \right]^{\frac{\alpha}{1-\alpha}}$$

④

$$K_{t_0} = \frac{1}{2} K_{SS}$$

CP: $K \downarrow \rightarrow K \downarrow \rightarrow y \text{ e } Y \downarrow$

LP: $K \rightarrow K_{SS}$ então $y \rightarrow y$

$y_t > y_{t_0-\varepsilon}$ pois $L_t > L_{t_0}$

#mesmo
para y

⑤

$n_{t_0} = n'$ → will impact steady-state

$$K'_{ss} = \left[\frac{s}{n' + \delta} \right]^{\frac{1}{1-\alpha}} > K_{ss}$$

Higher levels
lower SS growth
higher growth
during convergence
